These tables depict the predicted times and heights of the high and low waters for each day of the year near I Street on the Sacramento River in Sacramento, the Port of Sacramento, and Rio Vista. These stations are known as subordinate stations. These stations use the National Ocean Service tide prediction for the San Francisco tide gage at Golden Gate as the reference station. Tides are computed from a regression correlating Golden Gate tides with the subordinate station. Standard tide constants are not used.

Tides typically occur in a modified semidiurnal pattern called a mixed tide. This is where there are two highs and two low tides a day but the heights of the two successive highs are not the same, similarly for the two successive lows.

Times of high and low tide are set to Pacific Standard Time.

The time and cyclical regularity of the tides can be explained primarily by the harmonic effect of the moon and the sun on the earth. Other factors such as topography of the channel also come into play. Experience has shown that the heights of both high and low tides could be higher than predicted due to unusually strong onshore winds, a low barometric pressure and high river runoff. Conversely, the opposite could be true for strong offshore winds, a rising barometer and unusually low river levels. Forecasts for I Street are based on an assumed average flow of 15,000 cfs in the mainstem Sacramento River. This incorporates the normal dry season releases from Keswick, Oroville and Nimbus reservoirs. As meteorological and release change effects are constantly changing, I Street, Rio Vista, Antioch and Venice Island stage forecasts are updated daily in river bulletins jointly issued by the California-Nevada River Forecast Center and the California Department of Water Resources:

I Street: Lower Sacramento River Bulletin
Rio Vista, Venice Island, Antioch: Delta Tide Bulletin
