

F-CO program setup requirements 2015 03 16

The Forecast-Coordinated Operations program graphic user interface requires a few key settings on your desktop to open. This document is a simple set of instructions to set up java security access and file associations.

The two basic things required are:

- Adding the F-CO server to Java Control Panel Security exception site list
- Associating the F-CO launch program file (fco.jnlp) with the java web start executable (javaws.exe)

The Java Control Panel window is in the Programs menu and the file-type/executable window is in the Control Panel > Programs > Default Programs menu. You have to Browse or search for the location of the fco.jnlp file.

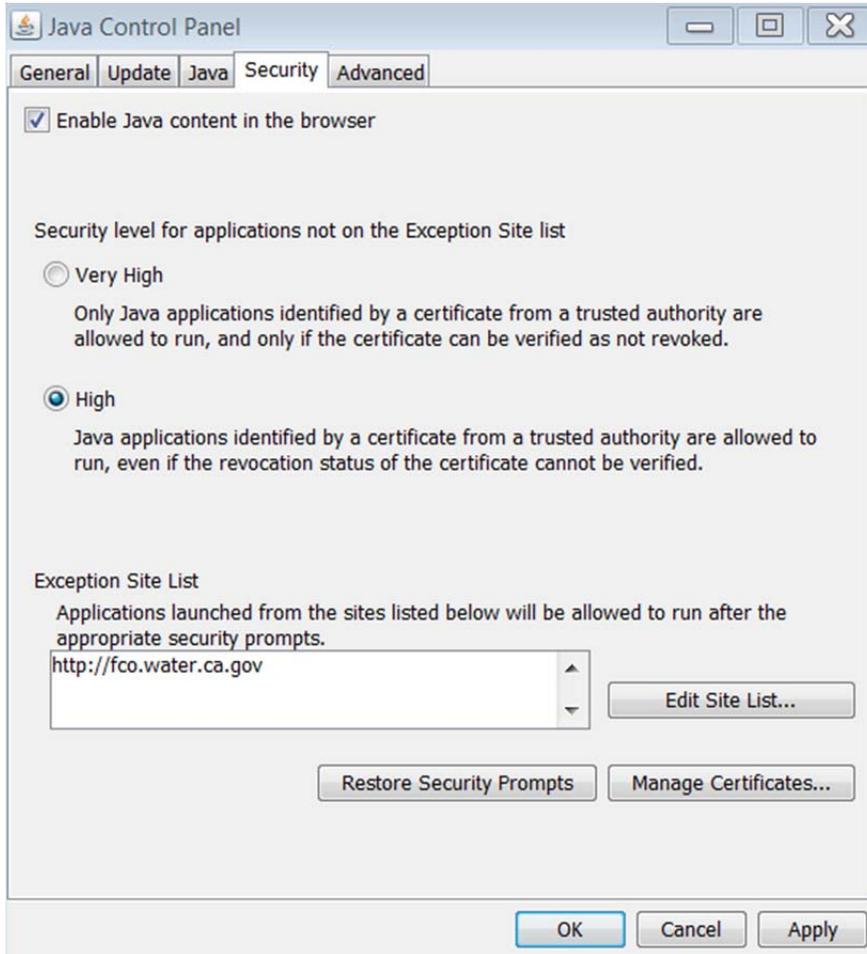

Figure 1: Java Control Panel Exception Site List

Figure 2: Control Panel > Programs > Default Programs- associate a file with an executable program

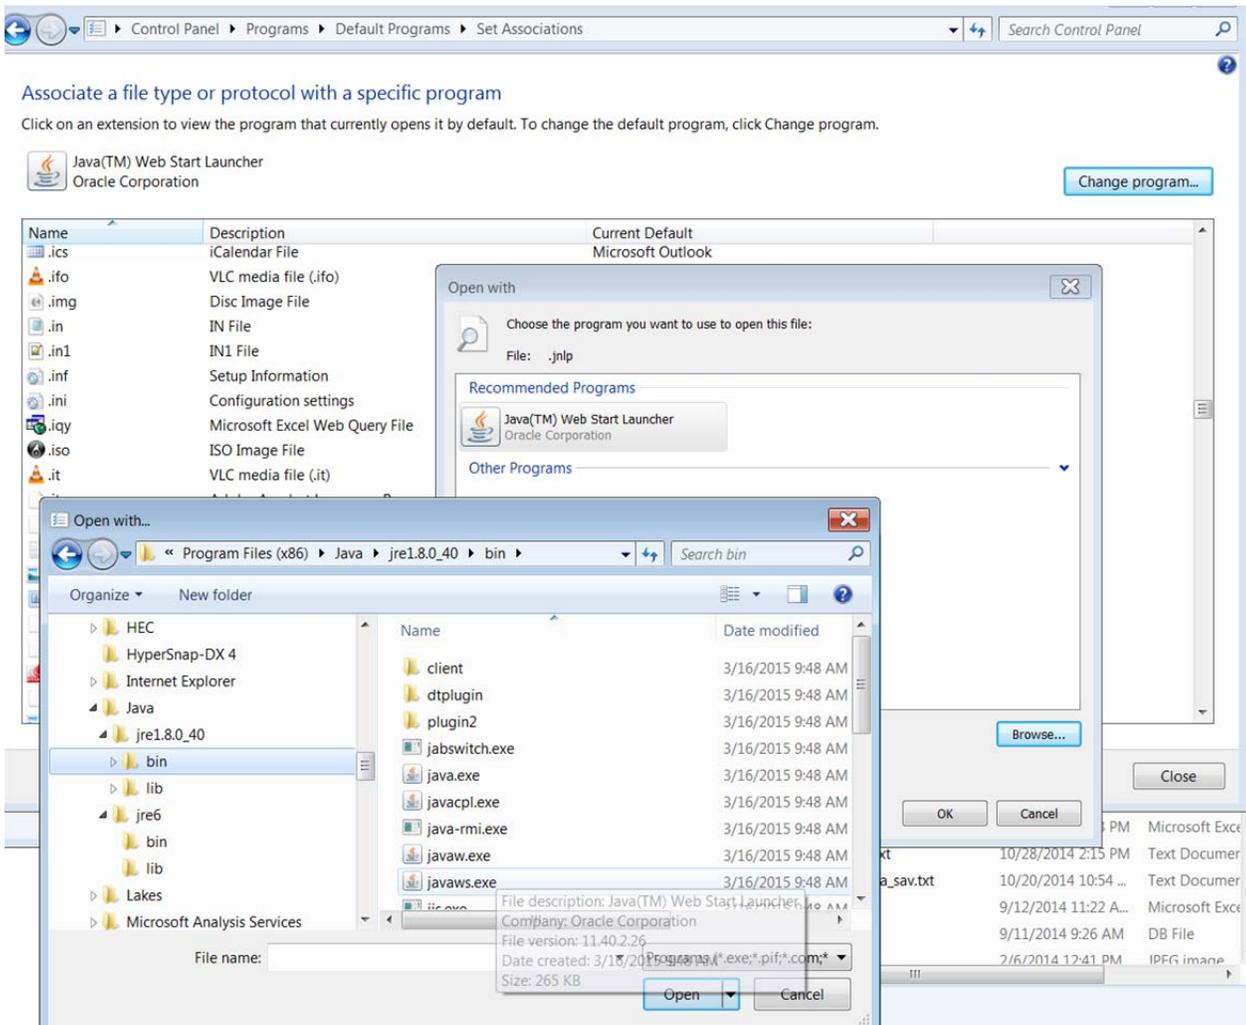

Figure 3: Browsing to select javaws.exe to associate fco.jnlp launching program with the web start executable
