

# Forecast-Coordinated Operations Program Update

62<sup>nd</sup> Annual Meeting of Cooperators  
November 3, 2016  
Fresno Flats, CA

Boone Lek, P.E.  
Reservoir Coordinated Operations Section  
Division of Flood Management  
California Department of Water Resources

# Today's Discussion

- San Joaquin F-CO Decision Support System
- F-CO Grant Program
- Beyond F-CO

# What is F-CO?

**Goal:** Improve flood protection without impacting water supply

**Objective:** Reduce downstream peak flood flows with improved

- Data, tools, and forecasts
- Communication and coordination of reservoir releases

# San Joaquin F-CO Tool Status

- Finalizing link to forecasts
- Developing sharing function
  
- Goal of operational before Feb 2017
- Plan to train operators to use tool this flood and snowmelt season

# F-CO Grant

- Tuolumne
- Merced
- San Joaquin
- Kings

# Beyond F-CO

Forecast-Informed Operations (F-IO) uses forecast like F-CO but prior to encroachment into the flood control pool.

## Benefits:

- Can reduce flood risk downstream of reservoirs
- Can provide water supply enhancement

## Risk:

- May not refill following pre-release

# Beyond F-CO

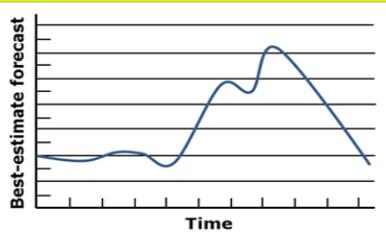

Evaluating F-IO at New Bullards Bar and Oroville:

- Leverage Folsom Dam F-IO work
- Use of short-term and seasonal ensemble reservoir inflow forecasts
- Detailed analysis to understand F-IO
- Approval of USACE and Congress to change the Flood Control Diagram

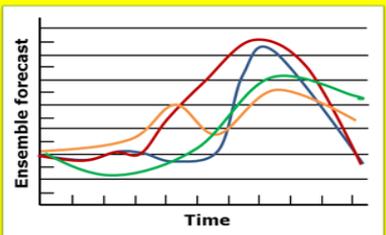

# Application of Ensemble Forecasting

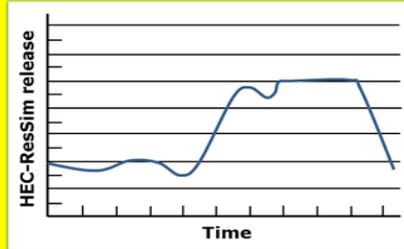

1. CNRFC provides *best estimate* forecast of reservoir inflows and uncontrolled local flows, using current state + QPF.

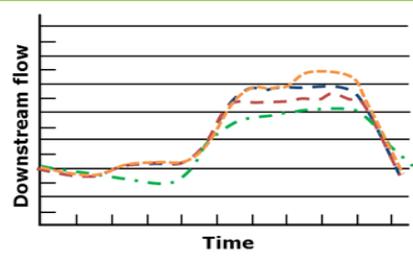

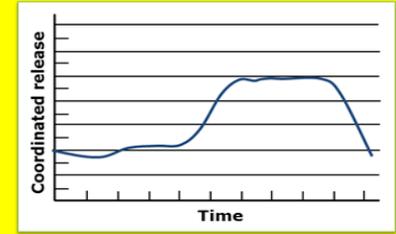

CNRFC also provides ensemble of forecasts of reservoir inflows and uncontrolled local flows. Some forecasts greater and some smaller than best estimate.

2. Operators run HEC-ResSim (through F-CO DSS interface) with best estimate forecast to identify recommended release schedule with strict interpretation of rules.

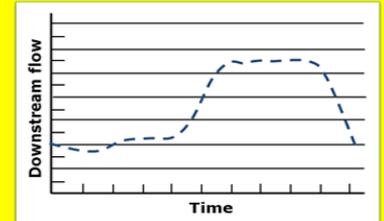

3. Operators review HEC-ResSim results, coordinate, collaborate to select *coordinated release schedule*.

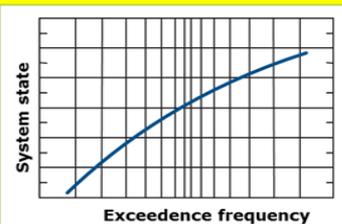

5. For each ensemble member, HEC-ResSim computes system states with coordinated release schedule from Step 3

4. Downstream conditions computed with HEC-ResSim, using coordinated schedule.

6. Frequency of exceedence of critical system states analyzed and reported. If hazard deemed unacceptable, process is repeated starting with Step 3.

### Wai'ale'ale Rain Gauge

This rain gauge was used by the United States Geological Society Water Resources Division from 1920 until the mid 1960's on 5,000 foot Mt. Wai'ale'ale on the Island of Kaua'i. This area is considered to be the *wettest spot on earth*. The gauge was constructed to hold 900 inches of rain. The cross-sectional area of the tank is 18.6 times that of the receiver cap. The gauge site was so inaccessible that it usually was visited only once a year using an overland route from the Westside. The highest measured rainfall in one year was 682.94 inches in 1982. The average annual rainfall is 440.17 inches.
