OPERATION AND MAINTENANCE MANUAL SACRAMENTO RIVER
FLOOD CONTROL PROJECT

SECTION I
INTRODUCTION

1-01. Authority of Existing Project. The Sacramento River Flood Control Project was adopted by the Flood Control Act of 1 March 1917, Public 367 - 64th Congress, (H. Doc. 61, 62nd Congress, 1st Session, as modified by Rivers and Harbors Committee Doc. No. 5, 63rd Congress, 1st Session), and modified by the Flood Control Act of 15 May 1928, Public No. 391-70th Congress, (S.Doc. No. 23, 69th Congress, 1st Session), the River and Harbor Act of 26 August 1937, Public 392, 75th Congress, 1st Session, (Senate Committee Print 75th Congress, 1st Session), and the Flood Control Act of 18 August 1941, Public 228, 77th Congress, 1st Session), (H.Doc. No. 205, 77th Congress, 1st Session).

1-02. Sacramento River Flood Control Project. The Sacramento River has its source in northern California, flows generally south, and enters Suisun Bay, a waterway of the San Francisco Bay System. The river is approximately 320 miles long and drains an area of about 27,000 square miles. After emerging from the foothills it flows through a broad alluvial valley some 50 miles wide. The river is under improvement for navigation, to provide a channel 10 feet deep to Sacramento, 59 miles from the mouth, with lesser depths upstream. The flood control system of the Sacramento River embraces the following principal features:

   a. Levees along the banks of the river and its tributaries.

   b. Weirs and floodways or by-passes to carry off flood waters in excess of the capacity of the leveed river channels.

   c. Enlargement of the river channel below Cache Slough to carry the entire flood flow.

1-03. Protection Provided. The Sacramento River Flood Control Project, when completed, will afford protection against flood damages to approximately 1,000,000 acres of land in the Sacramento Valley. The project is designed to provide protection against all floods of record and should not fail oftener than about once in 80 years on the average.
SECTION II
LOCAL COOPERATION

2-01. Requirements.

a. The Act of 18 August 1941, provides that "The projects for the control of floods and other purposes in the Sacramento River, California, adopted by the Acts approved March 1, 1917, May 15, 1928, and August 26, 1937, are hereby modified substantially in accordance with the recommendation of the Chief of Engineers in House Document Numbered 205, Seventy-seventh Congress, first session."

The recommendation of the Chief of Engineers contained in House Document 205, 77th Congress, 1st Session, provides for the "completion of the Sacramento Valley Flood Control Project at an estimated additional first cost to the United States of $10,500,000; subject to the provisions that the State of California or responsible local agencies give assurances satisfactory to the Secretary of War that they will provide, without cost to the United States, all lands, easements and rights-of-way necessary for the completion of the project; bear the expense of necessary highway, railroad, and bridge alterations; hold and save the United States free from claims for damages resulting from construction of the works; and maintain and operate all works, after completion, in accordance with regulations prescribed by the Secretary of War."

The Act of 18 August 1941 further provides "That the authorization for any flood control project heretofore or herein adopted requiring local cooperation shall expire five years from the date on which local interests are notified in writing by the War Department of the requirements of local cooperation, unless said interests shall within said time furnish assurances satisfactory to the Secretary of War that the required cooperation will be furnished."

b. The duties and liabilities of districts and public agencies are also provided in Section 8370 of the Water Code of the State of California as follows:

"It is the responsibility, liability, and duty of the reclamation districts, levee districts, protection districts, drainage districts, municipalities, and other public agencies within the Sacramento River Flood Control Project limits to maintain and operate the works of the project within the boundaries or jurisdiction of such agencies, excepting only those works enumerated in Section 8361 and those for which provision for maintenance and operation is made by Federal law."
2-02. Compliance of Local Cooperation. The duties and requirements listed under paragraph 2-01 a and b are carried out by the State of California and other local interests. Local requirements are administered and supervised by the Reclamation Board and the Division of Water Resources of the Department of Public Works of the State of California.

2-03. Maintenance and Operation of the Unit of Levee Covered by this Manual. The responsibility for the maintenance and operation of the unit of levee covered by this manual, described in paragraph 4-01, was accepted by the Reclamation Board of the State of California, as shown under attached resolution, Exhibit "F".
SECTION III
MAINTENANCE AND OPERATION

GENERAL PROCEDURE

3-01. Regulations. The purpose of this manual is to assist the local interests in the maintenance and operation of Flood Control Works constructed by the United States in accordance with the Flood Control Regulations contained under Section 208.10, Title 33 of the Code of Federal Regulations, approved by the Acting Secretary of War on 9 August 1944 under the authority covered by Section 3 of the Flood Control Act of 22 June 1936, as amended and supplemented. A copy of the approved regulations is bound at the back of this volume as Exhibit "A". Compliance with these regulations is one of the requirements of local cooperation.

3-02. Provisions. The general provisions under the Flood Control Regulations are listed below:

"1. The structures and facilities constructed by the United States for local flood protection shall be continuously maintained in such a manner and operated at such times and for such periods as may be necessary to obtain the maximum benefits.

2. The State political subdivision thereof, or other responsible local agency, which furnished assurance that it will maintain and operate flood control works in accordance with regulations prescribed by the Secretary of War, as required by law, shall appoint a permanent committee consisting of or headed by an official hereinafter called the "Superintendent," who shall be responsible for the development and maintenance of, and directly in charge of, an organization responsible for the efficient operation and maintenance of all of the structures and facilities during flood periods and for continuous inspection and maintenance of the project works during periods of low water, all without cost to the United States.

3. A reserve supply of materials needed during a flood emergency shall be kept on hand at all times.

4. No encroachment or trespass which will adversely affect the efficient operation or maintenance of the project works shall be permitted upon the rights-of-way for the protective facilities.

5. No improvement shall be passed over, under, or through the walls, levees, improved channels or floodways, nor shall any excavation or construction be permitted within the limits of the project right-of-way, nor shall any change be
made in any feature of the works without prior determination by the District Engineer of the War Department or his authorized representative that such improvement, excavation, construction, or alteration will not adversely affect the functioning of the protective facilities. Such improvements or alterations as may be found to be desirable and permissible under the above determination shall be constructed in accordance with standard engineering practice. Advice regarding the effect of proposed improvements or alterations on the functioning of the project and information concerning methods of construction acceptable under standard engineering practice shall be obtained from the District Engineer, or if otherwise obtained, shall be submitted for his approval. Drawings or prints showing such improvements or alterations as finally constructed shall be furnished the District Engineer after completion of the work.

6. It shall be the duty of the superintendent to submit a semi-annual report to the District Engineer covering inspection, maintenance and operation of the protective works.

7. The District Engineer or his authorized representative shall have access at all times to all portions of the protective works.

8. Maintenance measures or repairs which the District Engineer deems necessary shall be promptly taken or made.

9. Appropriate measures shall be taken by local authorities to insure that the activities of all local organizations operating public or private facilities connected with the protective works are coordinated with those of the Superintendent's organization during flood periods.

10. The War Department will furnish local interests with an Operation and Maintenance Manual for each completed project, or separate useful part thereof, to assist them in carrying out their obligations under these regulations."

3-03. Duties of the Superintendent. In line with the provisions covered by the regulations, the general duties of the Superintendent should include the following:

a. Training of Key Personnel. Key personnel should be trained in order that regular maintenance work may be performed efficiently and to insure that unexpected problems related to flood control may be handled in an expeditious and orderly manner. The superintendent should have available the names, addresses and telephone numbers of all his key men and a reasonable number of substitutes. These key men should in turn have similar data on all of the men that will be necessary for assistance in the discharge of their duties. The organization of key men should include the
following:

1. An assistant to act in the place of the Superintendent in case of his absence or indisposition.

2. Sector foremen in sufficient number to lead maintenance patrol work of the entire levee during flood fights. High qualities of leadership and responsibility are necessary for these positions.

b. Stream flow stages. Permanent arrangements should be made by the Superintendent with the Corps of Engineers at Sacramento, California, to secure stream flow stages and forecasts of stream flow stages and weather conditions of effective streams and drainage areas to properly plan adequate measures of protection.

c. Semi-annual Report. The semi-annual reports required under Paragraph 208.10(a)(6) of the regulations should be submitted within a ten day period prior to 1 June and 1 December of each year and should include all dated copies of reports of inspections made during the period of report. Also, the nature, date of construction, and date of removal of all temporary repairs and the dates of permanent repairs should be included in this report. Other items and suggestions relative to public cooperation, public sentiment on the protection obtained, and other allied subjects are considered pertinent and desirable data for inclusion in the report, but are not required.

d. Check lists. The check lists shown in Exhibit "D" and "E", should be used in each inspection to insure that no features of the protective system are overlooked. Items requiring maintenance should be noted thereon; if items are satisfactory they should be so indicated by a check.

e. Proposed improvements or alterations. Drawings or prints of proposed improvements or alterations to the existing Flood Control Works must be submitted for approval to the District Engineer, Sacramento District, Corps of Engineers, Sacramento, California, sufficiently in advance of the proposed construction to permit adequate study and consideration of the work. Drawings or prints, in duplicate, showing any improvements or alterations as finally constructed should be furnished to the Corps of Engineers after completion of the work.
SECTION IV
FEATURES OF THE PROJECT
SUBJECT TO FLOOD CONTROL REGULATIONS

4-01. Levees. a description. The unit of levee covered by this Manual forms an integral part of the Sacramento River Flood Control Project. It provides direct protection to Levee District No. 3 against high water of the Sacramento River. The grade of the flood plane varies from Elevation 86.3 at the lower end to 93.6 at the upper end, and the levee grade provides a freeboard of three feet above the flood plane. (All elevations are referred to U.S.E.D. Datum). It is estimated that a flood flow of 180,000 second-feet past this section of levees will produce the adopted flood plane. Such a flow is not expected to occur oftener than once in 200 years, on the average. Other information pertaining to Flood Control Works covered in this Manual is listed as follows:

(1) Location. The section of levee recently completed and particularly covered by this Manual is located along the easterly side of the Sacramento River, from Moulton Weir to Princeton-Butte City Road, approximately between Mile 158.5 and Mile 162.0, near Princeton, California, approximately 98.5 to 104.5 miles upstream from Sacramento, California. It forms part of the westerly boundaries of Levee District No. 3 and Reclamation District No. 816, as shown on attached drawing file No. 50-4-2216 dated April 1944 (See Exhibit "B").

(2) This levee measured along the outer line extends from Station 571+50 to 965+50, a distance of 39,400 feet. It has been constructed with slopes of 1 on 3 on the river side and 1 on 2 on the land side and a 20-foot crown. Construction also included a gravel road surfacing 12 feet wide on top of the levee with turnouts at 1,000-foot intervals, 50 feet long and 18 feet wide, and the necessary drainage structures, road approaches and appurtenances.

(3) Contractor. Construction was accomplished by Bresci and Nevanda, Contractors, under Contract No. W-04-167-eng-637, copy of which is on file in the U.S. Engineer Office, Sacramento District, Sacramento, California.

(4) Dates of Construction. Construction on this unit was initiated on 18 September 1944 and completed on 13 January 1945.

(5) Construction Features. In general, all construction features are based on Standard Plans and Specifications, and details are fully covered in the attached drawings listed below.

(6) Drawings. (See Exhibit "B" - Plates 1 to 5).

File No. 50-4-2216, in five sheets, entitled "Sacramento River, California, Flood Control Project, Proposed Levee Enlargement, East Levee, Sacramento River, Moulton Weir to Princeton-Butte City Road."
b. Pertinent Requirements of Section 208.10, Title 33, of Code of Federal Regulations.

"1. Maintenance. The Superintendent shall provide at all times such maintenance as may be required to insure serviceability of the structures in time of flood. Measures shall be taken to promote the growth of sod, exterminate burrowing animals, and to provide for routine mowing of the grass and weeds, removal of wild growth and drift deposits, and repair of damage caused by erosion or other forces. Where practicable, measures shall be taken to retard bank erosion by planting of willows or other suitable growth on areas riverward of the levees. Periodic inspections shall be made by the Superintendent to insure that the above maintenance measures are being effectively carried out and further, to be certain that:

(I) No unusual settlement, sloughing or material loss of grade or levee cross section has taken place;

(II) No caving has occurred on either the landside or the riverside of the levee which might affect the stability of the levee section;

(III) No seepage, saturated areas or sand boils are occurring;
(IV) Toe drainage systems and pressure relief wells are in good working condition, and that such facilities are not becoming clogged;

(V) Drains through the levese and gates on said drains are in good working condition;

(VI) No revetment work or riprap has been displaced, washed out, or removed;

(VII) No action is being taken, such as burning grass and weeds during inappropriate seasons, which will retard or destroy the growth of sod;

(VIII) Access roads to and on the levee are being properly maintained;

(IX) Cattle guards and gates are in good condition;

(X) Crown of levee is shaped so as to drain readily, and roadway thereon if any is well shaped and maintained;

(XI) There is no unauthorized grazing or vehicular traffic on the levees;

(XII) Encroachments are not being made on the levee right-of-way which might endanger the structure or hinder its proper and efficient functioning during times of emergency.

Such inspections shall be made immediately prior to the beginning of the flood season; immediately following each major high water period, and otherwise at intervals not exceeding 90 days, and such intermediate times as may be necessary to insure the best possible care of the levee. Immediate steps will be taken to correct dangerous conditions disclosed by such inspections. Regular maintenance repair measures shall be accomplished during the appropriate season as scheduled by the Superintendent.

2. Operation. During flood periods the levee shall be patrolled continuously to locate possible sand boils or unusual wetness of the landward slope and to be certain that:
(I) There are no indications of slides or sloughs developing;

(II) Wave wash or scouring action is not occurring;

(III) No low reaches of levee exist which may be overtopped;

(IV) No other conditions exist which might endanger the structure. Appropriate advance measures will be taken to insure the availability of adequate labor and materials to meet all contingencies. Immediate steps will be taken to control any condition which endangers the levee and to repair the damaged section."

Compliance with the provisions prescribed above is very essential for the efficient maintenance of the levee system covered by this manual and for the successful operation of the entire Flood Control Project of the Sacramento River.

c. Additional Requirements.

(1) The measures relating to the extermination of burrowing animals and to the prevention of inappropriate burning of grass are apparently of minor importance, but have been found to be major factors in levee maintenance. The work of gophers, muskrats and other burrowing animals have caused severe levee failures in the past. They are especially obnoxious when driven to the levee crest during periods of high water. Inappropriate burning of grass often leads to damage of the sod and consequent damage of the levee due to erosion.

(2) Check lists suggested under Exhibits "D" and "E" should be used in each inspection to insure that no features of the protective works are overlooked. Items requiring maintenance should be noted thereon; if items are found satisfactory they should be so indicated by a check.

(3) Periodic inspections as required by the Regulations should be made by the Superintendent at the following times:
(a) Immediately prior to the beginning of the major flood season, preferably within the ten day period prior to the months of June and November of each year. (The flood season is considered to include the period between the months of December and May).

(b) Immediately following each major high water period. (For definition of high water period see Exhibit "F").

(c) Otherwise at periods not exceeding 90 days.

(4) Suggestions as to methods of combating flood conditions are given in Section V of this manual. The methods presented therein have been developed during many years of experience during floods on large streams. These methods are not mandatory, but should prove useful in Sacramento Valley, where floods of large magnitude are of common occurrence.

4-02. Drainage Structures.

a. Description. The drainage structures covered by this manual form a part of the levee described in paragraph 4-01 a. These structures consist of drainage pipe or/and concrete culverts crossing the levee at approximately the elevation of the natural ground and are provided with automatic or hand operated gates as described in Check List No. 2, Exhibit "F".

b. Pertinent Requirements of Section 208.10, Title 33, of the Code of Federal Regulations.

1. Maintenance. Adequate measures shall be taken to insure that inlet and outlet channels are kept open and that trash, drift or debris is not allowed to accumulate near drainage structures. Flap gates and manually operated gates and valves on drainage structures shall be examined, oiled and trial operated at least once every 90 days. Periodic inspections shall be made by the Superintendent to be certain that:

(I) Pipes, gates, operating mechanism, riprap, and headwalls are in good condition;

(II) Inlet and outlet channels are open;
(III) Care is being exercised to prevent the accumulation of trash and debris near the structures and that no fires are being built near bituminous coated pipes;

(IV) Erosion is not occurring adjacent to the structures which might endanger its water tightness or stability.

Immediate steps will be taken to repair damage, replace missing or broken parts, or remedy adverse conditions disclosed by such inspection.

2. Operation. Whenever high water conditions impend, all gates will be inspected a short time before water reaches the invert of the pipe and any object which might prevent closure of the gate shall be removed. Automatic gates shall be closely observed until it has been ascertained that they are securely closed. Manually operated gates and valves shall be closed as necessary to prevent inflow of floodwater. All drainage structures in levees shall be inspected frequently during floods to ascertain whether seepage is taking place along the lines of their contact with the embankment. Immediate steps shall be taken to correct any adverse condition."

Compliance with the provisions prescribed above pertaining to drainage structures is essential for proper maintenance of the levee system covered by this manual. Levee failures caused by neglected drainage structures are of common occurrence; it is therefore of utmost importance that this structure always be kept in perfect working condition in accordance with the regulations.

c. Additional Requirements.

1. Inspections. Periodic inspections should be made as follows:

(a) The outlets of pipes crossing under the levee inundate at relatively low river stages; therefore all pipes crossing under the levee should be inspected considerably in advance of the beginning of the flood season. The gates on these pipes should be checked at the same time.
(b) Inspection of all drainage structures should also be made following each major high water period.

(c) Otherwise at periods not exceeding 90 days.

2. Check Lists of Drainage Structures. Check lists suggested under Exhibit "E" should be used in each inspection to insure that structures are kept in working condition at all times.
SECTION V

SUGGESTED METHODS OF COMBATING FLOOD CONDITIONS

5-01. Mission. The primary mission of the Corps of Engineers is to maintain the integrity of Flood Control Works. All other matters become secondary in a flood emergency and will yield precedence to the accomplishment of the primary mission. During periods of emergency, close liaison will be maintained with local interests, normally through the responsible State Agency such as the Reclamation Board of the State of California, since the main objective will be attained by supporting local interests in their efforts or by assuming full charge for the flood fight when the problem is beyond the capabilities of local interest.

5-02. Methods Suggested. Most of the methods described herein have been developed during years of experience with the various problems that often come up during periods of high water, and they are not intended to restrict the Superintendent, or others concerned, to a rigid set of rules for every condition that may arise. The remarks are primarily concerned with the earthen portions of the levee system. If problems not covered by these suggestions arise, where the Superintendent is in doubt as to the procedure to be taken, he will be expected to consult the District Engineer, U.S. Engineer Office, Sacramento, California, and follow standard engineering practices in meeting the situation. It should be noted that it is much better to be over-prepared for a "flood fight" than to find at the last moment that preparations were incomplete or unsatisfactory. Confidence of the protected persons and firms is a valuable asset that should not be carelessly lost through inefficient operation of the protection system in time of emergency.

5-03. Earthen Levees. An earthen levee is in danger whenever there is water against it. This danger is directly proportional to the height of the water, the duration of the flood stage, and the intensity of either the current or wave action. The danger is inversely proportional to the cross-sectional area of the levee, the levee's heights, and the degree of maintenance. A well-constructed levee of proper section should, if maintained and not overtopped, hold throughout any major flood. However, a serious accident may result in a break. Foundation troubles result in sand boils or a sinking levee, and the local use of unsatisfactory materials causes slides and sloughs. However, such threatened failures can be met if prompt action is taken and proper methods of treatment are used. Wave wash is to be expected whenever the levee is exposed to a wide stretch of open water and is serious if permitted to continue over a considerable length of time.
5-04. Premeditated Damage. The Superintendent should continually guard against premeditated damage to the levee. In the event of an extraordinary flood requiring a fight over long stretches of levee on both sides of the river, there is a natural temptation to relieve the strain by premeditated breaking of the opposite line.

5-05. Security. Personnel of the Corps of Engineers, whether military or civilian, are not vested with any civil police authority in the performance of their engineering duties, and they will not attempt to exercise any such authority. The responsibility for protecting flood control works against sabotage, acts of depredation, or other unlawful acts rests with the local interests through local and State Governmental agencies. In the event local law enforcement agencies prove inadequate, local interests can request the aid of State Forces, and if additional support becomes necessary, Federal troops can be requested as provided by law.

5-06. Human Element. Panic does not directly endanger the levee, but psychological fear due to ignorance of actual conditions may seriously affect the high-water fight during a critical moment. This fact may be considered in organization for emergency work. Confidence, engendered by an efficient organization, free from local jealousies, is the best guard against panic.

5-07. Inspection of Flood Control Works. Immediately upon receipt of information that a high water is imminent, the Reclamation Districts through their Superintendents, should form a skeleton organization, capable of quick expansion, and assign individuals (Sector Foremen) to have charge of definite sections of levees. As his initial activity, each Sector Foreman should go over his entire sector and parts of adjacent sectors, making a detailed inspection, particularly with reference to the following matters:

a. Sector limits; ascertain that the dividing line between sectors is plainly determined and, if necessary, marked.

b. Condition of new levees and recent repairs.

c. Condition of culverts, flap gates, and sluice gates.

d. Transportation facilities; roads, rail and water communications.

e. Material supply; quantity, location, and condition.

f. Communications; locate and check all necessary telephones in the sector.
5-08. Preliminary Repair Work. After the initial inspection has been made, each Sector Foreman should recruit a labor crew and provide it with tools such as shovels, axes, wheelbarrows, etc. In addition, bulldozers, scrapers, trucks, etc., should be located and made ready for use in case of emergency. Then immediate action should be taken to perform the following work:

a. Fill up bad holes or washes in the levee crown, slopes, and landslide berms. Where new construction has been completed during the year, rain washes and deep gullies may have developed. While the levee is new, preparations should be made in advance to combat wave wash along the exposed reaches.

b. Repair gaps where road crossings have been worn down and the levee is below grade. In filling the road crossings, it may be necessary to obtain material from landside borrow pits, in which case excavation for the material should be kept at least 50 feet from the toe of levee. Any filling done in this connection should be tamped in place and, if in an exposed reach, subject to wave wash, the new section should be faced with bags of sand.

c. Repair and close all flap gates on culverts and see that they are seated properly before they are covered with flood waters.

d. Ascertain that all roads to and along the levee are in a good state of repair. The Superintendent should obtain assistance from the county road forces to have all roads put in first-class condition.

e. Locate necessary tools and materials (sacks, sandbags, brush, lumber, lights, etc.), and distribute and store the same at points where active maintenance is anticipated.

f. Check and obtain repair of all telephone lines necessary for operation, obtain lists of all team forces, motorboats, motor cars, and truck transportation that can be made available.

g. Make thorough arrangements with reliable citizens of the community for the supply, transportation, subsistence, and shelter for the necessary labor.

h. Communicate directly with owners of all stock pastured on the levee and direct that all stock be removed from the levee right-of-way. Cut all fences crossing the levee that do not have gates provided.

i. Investigate all drainage ditches on the landside of the levee and open these drains when obstructions exist. Prepare to cut the necessary seep drainage ditches; however, no attempt should be made to drain the levee slope until actual seepage takes place.
j. Remove all dynamite and explosives of any kind from the vicinity of the levee.

5-09. Disaster Relief. It is the responsibility of local, state, municipal authorities, supported by and/or working in connection with the American Red Cross to adopt measures for the relief of flood disaster victims. Relief measures can be undertaken by the War Department through its Army Area Commander under existing Army Regulations, but such measures will be undertaken only as a last resort, in extreme cases and under compelling circumstances where local resources are clearly inadequate to cope with the situation.

5-10. Flood Fight. After the above preliminary organization and precautions have been completed, the "Flood fight" itself commences. The methods of combating various defects in the earthen levee described in the following paragraphs have been proved effective during many years of use by the War Department.

a. Drainage of slopes. This work can be done economically while awaiting developments and will serve to make the levees more efficient. Crews should be organized to cut seep drains at all places on the levee and berm when seepage appears. The drains should be V-shaped, no deeper than necessary, and never more than 6" deep. Care must be taken not to cut the sod unnecessarily. In all instances, drains should be cut straight down the levee slope or nearly so. Near the toe of the slope the small drains should be Y'd together and led into larger drains, which, in general, should lead straight across the landside berm into the landside pits or nearest natural or artificial drain.

b. Sandboils. These danger spots are serious if discharging material. The common method of controlling sand boils consists of walling up a watertight sack ring around the boil up to a height necessary to reduce the velocity of flow to a point at which material is no longer discharged from the boil. See Exhibit "G" Plate 1. The sack ring around the boil should be large enough to protect the defective area immediately surrounding the boil. If several boils of sufficient force to displace sand are observed a sack sublevee may be built around the entire nest of boils, rising to such a height that none of the boils will discharge with enough force to displace sand.

c. Wave Wash. The Superintendent and Sector Foremen should study the levee beforehand to determine the possibility of wave wash. All such reaches will be located well in advance and for use in emergency, a reserve supply of filled sacks and rolls of cotton bagging will be kept on board flats. If the slope is well sodded, a storm of an hour's duration should cause very little damage. During periods of high wind and high water, ample labor should stand by and experienced personnel should observe where the washouts are beginning by sounding or by actually wading along the
submerged slope. Sections of cotton bagging should be placed over the washed areas, as shown on Exhibit "C", Plate 3. As an alternative, filled sacks should be placed in the cut in an effective manner and as soon as possible. The filled sacks should be laid in sections of sufficient length to give protection well above the anticipated rise. Bagging so laid must be thoroughly weighted down to be effective. Plate 2, Exhibit "C" shows a movable type of wave wash protection, also used with good results. Its advantage is that it can rapidly be built at any convenient place and easily set in place on the job.

d. Scouring. A careful observation should be made of the riverside of the levee at all localities where a current of more than two feet per second is observed, or where the profiles show a high water slope of two feet per mile or greater. Trouble may be looked for at the ends of old levee dikes, road-crossing ramps, old traverses, and places where pipes, sewers and other structures penetrate the levee. If any sign of scour is observed in the pits or at the ends of the dikes, soundings should be taken to observe the amount and progress of the scour. The approved method of construction to check scour in the pits, on the slopes, or at the ends of dikes will be to construct deflection dikes using brush, treetops, or lumber, driving stakes and wiring together, and filling in between with brush and filled sacks or stone.

e. Caving bank protection. As protection against active caving of riverbanks, rock-filled cribs are very effective if properly placed. Cribs are usually 14 by 14 feet in plan by 10 to 14 inches in inside depth. The cribs are constructed on a double thickness of 1" x 4" x 14' lumber, equivalent to 2" x 4" pieces, lapped rail fence fashion at all corners and intersections. They are divided into four compartments of about equal area by two perpendicular cross walls constructed in the same manner as the side walls. The floors and covers are built up of double 1" x 4" boards spaced about 8" center-to-center. Under the floor and perpendicular to the direction of the floor boards are five equally spaced pairs of 1" x 4" boards about 3 feet center-to-center. On top of the cover, perpendicular to the direction of the cover boards, are three pairs of top boards, one over each of the side walls and one over the central division wall. All intersections are nailed with one 20d nail. The compartments are filled with rock before covering. Each wall intersection of the fabricated cribs is securely fastened by a loop of No. 9 wire. See Exhibit "C", Plate 4.

5-11. Topping. Immediate consideration should be given the grade line of each levee section by comparison of existing grades with those shown on the drawings, Exhibit "B", Plates 1 to 5. If
any reaches show a grade below the previous highest water, emergency topping should be undertaken at once to such a grade as may be established by the District Engineer, U.S. Engineer Office, Sacramento, California, as follows:

a. **Sack topping.** Sack topping may be used to raise the crown of the levee about three feet. The sacks should be laid stretcherwise or along the levee for the first layer, crosswise for the second layer, and so on. Sacks should be lapped at least 1/3 either way and well mauled into place. When properly sacked and tamped, one sack will give about three to four inches of topping. If gravel is available, it should be used for the front facing so as to avoid washing out.

b. **Lumber and sack topping.** This is the most commonly used method of raising low reaches in emergencies. In putting on this topping, as well as other topping, a careful line of levels should be run and grade stakes set in advance. 2" x 4" x 6" stakes should then be driven on the riverside of the crown six feet apart, and 1" x 12" boards nailed to the landside of the stakes. This wall, backed with a single tier of sacks, will hold out at least one foot of water. If a second foot is necessary, the layers of sacks will have to be increased in number and reinforced. The stakes should be driven three feet in the ground, and should project out three feet, thus providing, in extreme cases, a three-foot topping if properly braced behind with sacks and earth. In some instances, it may be practicable to back up the planking with tamped earth obtained in the vicinity in lieu of the sacks shown in the drawing, Exhibit "C", Plate 5.

5-12. **Transportation.** In instances where it is necessary to send equipment over roads that are impassable due to mud or sand, their passage may be provided by the use of a plank road or by means of steel or wire mats. Telephone communication should be provided along dangerous stretches of the levee when travel or other satisfactory means of communication cannot be maintained.

5-13. **Check lists.** The check lists shown in Exhibits "D" and "E" are furnished for reproduction and use by the local interests. These lists should be used in each inspection to insure that no features of the protective system are overlooked. Items requiring repairs should be noted thereon; if items are satisfactory, they should be indicated by a check mark.

5-14. **Use of Government Plant.** The District Engineer is authorized to use or loan Government property and plant in cases of emergency where life is in danger and there is no opportunity to secure prior authority for such use. The authority also extends to saving of property where no suitable private equipment is available, provided that such use is without detriment to the Government.
TITLE 32—NAVIGATION AND NAVIGABLE WATERS
Chapter II—Corps of Engineers, War Department
PART 208—FLOOD CONTROL REGULATIONS
MAINTENANCE AND OPERATION OF FLOOD CONTROL WORKS

Pursuant to the provisions of section 3 of the Act of Congress approved June 22, 1938, as amended and supplemented (49 Stat. 487; and 56 Stat. 538; 33 U.S. C. 701c; 701c-1), the following regulations are hereby prescribed to govern the maintenance and operation of flood control works:

§ 208.10 Local flood protection works; maintenance and operation of structures and facilities—(a) General. (1) The structures and facilities constructed by the United States for local flood protection shall be continuously maintained in such a manner and operated at such times and for such periods as may be necessary to obtain the maximum benefits.

(2) The State, political subdivision thereof, or other responsible local agency, which furnished assurance that it will maintain and operate flood control works in accordance with regulations prescribed by the Secretary of War, as required by law, shall appoint a permanent committee consisting of or headed by an official hereinafter called the "Superintendent," who shall be responsible for the development and maintenance of, and security in charge of, an organization responsible for the efficient operation and maintenance of all of the structures and facilities during flood periods and for continuous inspection and maintenance of the project works during periods of low water, all without cost to the United States.

(3) A reserve supply of materials needed during a flood emergency shall be kept on hand at all times.

(4) No encroachment or trespass which will adversely affect the efficient operation and maintenance of the project works shall be permitted on the right-of-way for the protective facilities.

(5) No improvement shall be passed over the works, or with the walls, or through improved channels or floodways, nor shall any excavation or construction be permitted at the limits of the protected right-of-way, nor shall any change be made in any feature of the works without prior determination by the District Engineer or his authorized representative that such improvement, excavation, construction, alteration, or addition will not adversely affect the functioning of the protective facilities. Such improvements or alterations as may be found to be desirable and necessary shall be determined and shall be determined shall be determined in accordance with standard engineering practice. Advice regarding the effect of proposed improvements or alterations on the functioning of the project and information concerning methods of construction acceptable under standard engineering practice shall be obtained from the District Engineer or, if otherwise obtained, shall be approved by the District Engineer after completion of the work.

(6) It shall be the duty of the Superintendent to prepare and submit a biennial report to the District Engineer covering inspection, maintenance, and operation of the protective works.

(7) The District Engineer or his authorized representatives shall have access at all times to all portions of the protective works.

(8) Maintenance measures or repairs which the District Engineer deems necessary and expedient shall be carried out or made.

(9) Appropriate measures shall be taken by local authorities to insure that the activities of all local organizations operating in public or private facilities connected with the protective works are coordinated with those of the Superintendent's organization during flood periods.

(10) The War Department will furnish local interests with an Operation and Maintenance Manual for each completed project, or separate useful part thereof, to assist them in carrying out their obligations under these regulations.

(b) Levees—(1) Maintenance. The Superintendent shall provide at all times such maintenance as may be required to insure stability of the levees and structure during flood conditions. Measures shall be taken to promote the growth of sod, exterminate burrowing animals, and to provide for removal of excess vegetation, grass, and weeds, removal of wild growth and drift deposits, and repair of damage caused by erosion or other causes. Where practicable, measures shall be taken to reestablish erosion by planting of willows or other suitable growth on areas riverward of the levees. Periodic inspections shall be made by the Superintendent to insure that the above maintenance measures are being carried out and, further, to be certain that:

(i) No unusual settlement, sloughing, or material loss of grade of levee cross section has taken place;

(ii) No caving has occurred on either the land side or the river side of the levee which might affect the stability of the levee section;

(iii) No seepage, saturated areas, or sand boils are occurring;

(iv) There is no drainage system and pressure relief works are in good working condition, and that such facilities are not becoming clogged;

(v) Drains through the levees and gates on said drains are in good working condition;

(vi) No revetment work or riprap has been displaced or removed;

(vii) No action is being taken, such as burning grass and weeds during inappropriate seasons, which will retard or destroy the growth of sod;

(viii) Access roads to and on the levees are being properly maintained;

(ix) Gullies towards and gates are in good condition;

(x) Crown of levee is shaped so as to drain readily and freely under conditions, if any, is well shaped and maintained;

(xi) There is no unauthorized grazing or vehicular traffic on the levee;

(a) Encroachment or trespass on the levee right-of-way which might endanger the structure or hinder its protection during the flood season is immediately carried out by such inspections. Regular maintenance repair measures shall be accomplished during the appropriate season and scheduled by the Superintendent.

(2) Operation. During flood periods the levees shall be patrolled continuously to locate possible openings or other apparent loss of the landside slope and to be certain that:

(i) There are no indications of slides or sloughs developing;

(ii) Wave wash or scouring action is not occurring;

(iii) No levee reaches of levee exist which may be overtopped;

(iv) No other conditions exist which endanger the levee structure.

Appropriate advance measures will be taken to insure the availability of adequate labor and materials to meet all contingencies. Immediate steps will be taken to control any condition which endangers the levee and to repair the damaged section.

(c) Flood walls.—(1) Maintenance. Periodic inspections shall be made by the Superintendent to be certain that:

(i) No seepage, saturated areas, or sand boils are occurring;

(ii) No undue settlement has occurred which affects the stability of the wall or its water tightness;

(iii) No trees exist, the roots of which might extend under the wall and offer accelerated seepage paths;

(iv) The concrete has not undergone cracking, chipping, or breaking to an extent which might affect the stability of the wall or its water tightness;

(v) There are no encroachments upon the right-of-way which might endanger the structure and hinder its functioning in time of flood;

(vi) Care is being exercised to prevent accumulation of trash and debris adjacent to walls, and to insure that no fires are being built near them;

(vii) No bank caving conditions exist riverward of the wall which might endanger its stability;

(viii) Toe drainage systems and pressure relief works are in good working condition, and the such facilities are not becoming clogged.

Such inspections shall be made immediately prior to and during the flood season, immediately following each major high water period, and otherwise at intervals not exceeding 60 days. Measures underslie eliminate encroachments and effect repairs found necessary by such inspections shall be undertaken immediately. All repairs shall be made by methods acceptable in standard engineering practice.

(2) Operation. Continuous patrol of the wall shall be maintained during flood periods to locate possible leakage at monolith joints or seepage areas. Sediment in the water. Floating objects or boats will not be allowed to lie against or tie up to the wall. Should it become necessary during a lower stage by emergent debris over the wall, adequate means are to be taken to protect the conc and connection joints. Immediate steps shall be taken to correct any condition which endangers the stability of the wall.

(d) Drainage structures.—(1) Maintenance. All drainage structures shall be taken to insure that inlet and outlet channels are kept open and that trash, drift, or debris is not allowed to affect the drainage structures. Flap gates and manually operated gates and valves on

EXHIBIT "A" Sheet of 2 52-9778-58
drainage structures shall be examined, oiled, and trial operated at least once every 90 days. Where drainage structures are provided with stop log or other emergency means for the control of the equipment and its housing shall be inspected regularly and a trial installation of the emergency means shall be given at least once each year. Periodic inspections shall be made by the Superintendent to be certain that:
(i) Inlet and outlet channels are open;
(ii) Care is being exercised to prevent the accumulation of trash and debris near the structures and that no fires are being built near bin-lined coated pipes;
(iii) Erosion is not occurring adjacent to the structure which might endanger its water tightness or stability.

Immediate steps will be taken to repair damage, replace missing or broken parts, or remedy adverse conditions disclosed by such inspections.

(2) Operation. Whenever high water conditions impede, all gates shall be inspected and opened before water reaches the invert of the pipe and any object which might prevent closure of the gate shall be removed. Automatic gates shall be inspected each operating day and confirmed that they are securely closed. Manually operated gates and valves shall be closed as necessary to prevent inflow of flood water. All drainage structures in levees shall be inspected frequently during floods to ascertain whether seepage is taking place along the lines of these contacts with the embankment. Immediate steps shall be taken to correct any adverse conditions.

(3) Closure structures—(1) Maintenance. Close-out structures for traffic openings shall be inspected by the superintendent every 90 days to be certain that:
(i) No parts are missing;
(ii) Metal parts are adequately covered with paint;
(iii) All movable parts are in satisfactory working order,
(iv) Proper closure can be made promptly when necessary;
(v) Sufficient materials are on hand for the erection of sand bag closures and that the necessary materials are readily accessible in times of emergency.

These parts shall not be removed for other use. Trial erections of one or more closure structures shall be made once each year, alternating the structures chosen so that each will be erected at least once in each 3-year period. Trial erection of all closure structures shall be made whenever a change is made in key operating personnel. Where railroad operation makes trial erection of a closure structure feasible, rigorous inspection of the operating personnel may be substituted therefor. Trible erection of sand bag closures is not recommended and such materials will be carefully checked prior to and following flood periods, and damaged or missing parts shall be repaired or replaced immediately.

(2) Operation. Erection of movable closure shall be started in sufficient time to permit completion before flood waters reach the top of the structure sill. Information regarding the proper method of erecting each individual closure shall be given to the crew together with an estimate of the time required by an experienced crew to complete its erection will be given in the Operation and Maintenance Manual which will be furnished local interests upon completion of the project. Closure structures must be adjusted as required during flood periods to ascertain that no undue leakage is occurring and that drains provided for ordinary leakage are functioning. Beams of the floating plant shall not be allowed to tie up to closure structures or to discharge passengers or cargo over them.

(1) Pumping plants—(1) Maintenance. Pumping plants shall be inspected by the Superintendent at intervals not to exceed 30 days during flood season and 90 days during off-flood seasons to insure that all equipment is in order for instant use. At regular intervals, proper measures shall be taken to provide for cleaning plant, buildings, and equipment, repainting as necessary, and lubricating all machinery. Adequate supplies of lubricants for all types of machines, fuel for gasoline or diesel powered equipment, flash lights or lanterns for emergency lighting shall be kept on hand at all times. Telephone service shall be maintained at pumping plants. All equipment, including switch gear, transformers, motors, pumps, and gates shall be trial operated and checked at least once every 90 days. Megger tests of all insulated networks shall be made whenever wiring has been subjected to undue dampness and otherwise at intervals not to exceed one year. A record shall be kept showing the results of such tests. Wiring discloses to be in an unsatisfactory condition by such tests shall be brought to a satisfactory state or be promptly replaced. Diesel and gasoline engines shall be started at such intervals and allowed to run for such length of time as may be necessary to insure their serviceability in times of emergency. Only skilled electricians and mechanics shall be employed on tests and repairs. Operating personnel for the plant shall be present during tests. Any equipment removed from the station for repair or replacement shall be returned or replaced as soon as practicable and shall be trial operated after reinstallation. Routine removal of equipment from the plant shall be made during off-flood seasons insofar as practicable.

(2) Operation. Competent operators shall be on duty at pumping plants whenever it appears necessary for pump operation is imminent. The operator shall thoroughly inspect, trial operate, and place in readiness all plant equipment. The operator shall be familiar with the equipment manufacturers' instructions and drawings and the "Operating Instructions" for each station. The equipment shall be operated in accordance with the above-mentioned "Operating Instructions" and care shall be exercised in the lubrication being supplied all equipment, and that no overheating, undue vibration or noise is occurring. At any time when high or low water, flood or temporary storage of interior run-off during flood periods, shall not be allowed to become filled with silt, debris, or dumped materials. The Superintendent shall take proper steps to prevent restriction of drainage openings and, where practicable, shall provide for temporary raising during floods of bridges which restrict channel facilities during high flows; and

(ii) The channel or floodway is not being restricted by the depositing of waste materials, building of unauthorized structures, or other conditions;
(iii) The capacity of the channel or floodway is not being reduced by the formation of shoals.

Banks are not being damaged by rain or wave wash, and that no sloughing of banks has occurred;
(iv) Riprap sections and deflection dikes and walls are in good condition;
(vi) Approach and egress channels adjacent to the improved channel or floodway were sufficiently protected with obstruction and debris to permit proper functioning of the project works.

Such inspections shall be made prior to the beginning of the flood season and other times at intervals not to exceed 90 days. Immediate steps will be taken to remedy any adverse conditions disclosed by the inspections. Such inspections shall be taken by the Superintendent to promote the growth of grass on bank slopes and other exposed embankment. The Superintendent shall provide for periodic repair and cleaning of debris basins, check dams, and related structures as may be necessary.

(2) Operation. Both banks of the channel shall be patrolled during periods of high water, and measures taken to protect those reaches being attacked by the current or by wave wash. Appropriate measures shall be taken to protect the riprap and other bank structures. Funds for the purpose of planting grass or other vegetation shall be provided for by the Federal Government. Land owners shall be provided for temporary repair and cleaning of debris basins, check dams, and related structures as may be necessary.

(3) Miscellaneous facilities—(1) Maintenance. Miscellaneous structures and facilities constructed as a part of the protective works and other structures and facilities which function as a part of, or affect the efficient functioning of the protective works, shall be periodically inspected by the Superintendent and appropriate maintenance and repairs shall be promptly undertaken. Damaged or unserviceable parts shall be repaired or replaced without delay. Adequate funds shall be provided for the purpose of replacing, replacing, and repairing plant, equipment and buildings or temporary storage of interior run-off during flood periods; shall not be allowed to become filled with silt, debris, or dumped material. The Superintendent shall take proper steps to prevent restriction of drainage openings and, where practicable, shall provide for temporary raising during floods of bridges which restrict channel facilities during high flows; and

(2) Operation. Miscellaneous facilities shall be operated to prevent or reduce flooding during periods of high water. The facilities are constructed as a part of the protective works shall not be used for purposes other than flood protection without approval of the District Engineer. The District Engineer unless designed therefor. (40 Stat. 1571, 50 Stat. 677; and 55 Stat. 838; 33 U.S.C. 701c; 701c-1) (Reg. 9 August 1944, CE SWEFWP)

[Seal]  
J. A. ULDO,  
Major General,  
The Adjutant General.
LANDSIDE

Note:
Bottom width to be no less than 1½ times height.
Be sure to clear sand discharge.
Tie into levee if boil is near toe.

ELEVATION

SECTION A-A

Note:
Do not sack boil which does not put out material.
Height of sack loop or ring should be only sufficient to create enough head to slow down flow through boil so that no more material is displaced and boil runs clear.
Never attempt to completely stop flow through boil.

Date
CONSTRUCTION - LEVEES -  
SACRAMENTO RIVER, EAST; Moulton Weir to Princeton-Butte City Road -

2. Acceptance and maintenance of -

Notice of completion of the above levee unit having been transmitted from the U.S. Engineer Office under date of February 6, 1945, upon motion by Mr. Lodi, seconded by Mr. Shannon, and carried by the unanimous vote of the members, the following resolution, accepting said levee unit as completed and turning over the same, for maintenance, to Levee District No. 3 of Glenn County and the State Department of Public Works, was adopted:

WHEREAS The Reclamation Board on February 21, 1945, did approve a certain item of "new construction", said work consisting of the construction of the East levee of the Sacramento River, from Moulton Weir to Princeton-Butte City Road; and

WHEREAS the War Department, U. S. Engineer Office, District Engineer, under date of February 6, 1945, has notified The Reclamation Board of the completion of such work of "new construction" and its desire to turn over to The Reclamation Board such work as completed, for maintenance by the proper local interests; and

WHEREAS the section of said levee lying north of the south line of Glenn County line lies within the boundaries of Levee District No. 3 of Glenn County, which district is required by law to operate and maintain said levee; and

WHEREAS the section of said levee lying between Moulton Weir and a point four miles northerly therefrom, the same being that portion of said levee lying southerly of the south line of Glenn County, is to be maintained by the Department of Public Works in accord with the provisions of Section 8361 of the Water Code; and

WHEREAS the Chief Engineer of The Reclamation Board has caused to be made inspection on the ground of such work of "new construction," and has found and determined that such work, as completed has been prosecuted and carried out in conformance with the plans and specifications therefor; now, therefore, be it
RESOLVED AND ORDERED, That The Reclamation Board does hereby accept, for the State of California, the said item of "new construction" as aforesaid which has, on the date hereinabove set forth, been turned over to said Board by the War Department, U.S. Engineer Office; and be it further

RESOLVED AND ORDERED, That said work be turned over to Levee District No. 3 of Glenn County for that portion of said levee lying north of the south line of Glenn County, and to the Department of Public Works for that portion of said levee lying south of the south line of Glenn County, for maintenance and operation of each such portion, respectively, as the legally authorized function of said agencies.

STATE OF CALIFORNIA
COUNTY OF SACRAMENTO
Office of The Reclamation Board

/\  S. A. HONAKER, ASSISTANT SECRETARY, The Reclamation Board
do hereby certify that the attached is a true and correct copy of an excerpt from minutes of The Reclamation Board held February 21, 1945.

IN WITNESS WHEREOF, I have hereunto set my hand and affixed the official seal of The Reclamation Board, this 12 day of November, 1946.
